- For tools:
  - Read the manual
  - Read the paper
- Good general references:
  - The O'Reilly BLAST book
  - Durbin, Eddy, Krogh, and Mitcheson (HMMs)
  - Numerical Recipes
  - Branden & Tooze

# Every object should have an isomorphism to a file

- Export, audit, edit, and import *independent* of a given program.
- Standard file formats for portability.
- Don't be afraid to look inside and hack on *your* data files.

# A few techniques can solve many problems

Iteration, clustering, dynamic programming, ...

# Run times are predictable and measurable

# Heuristics and stochastic sampling for hard problems

BLAST, HMMer3, BAGEL, MrBayes, ...

# Evolution is a rich source of information

- Infer homology from sequence similarity
- More sequences provide more information

# HMMs capture position and gap information

# Phenotype is more diverse than Genotype

# Phenotype is more diverse than Genotype

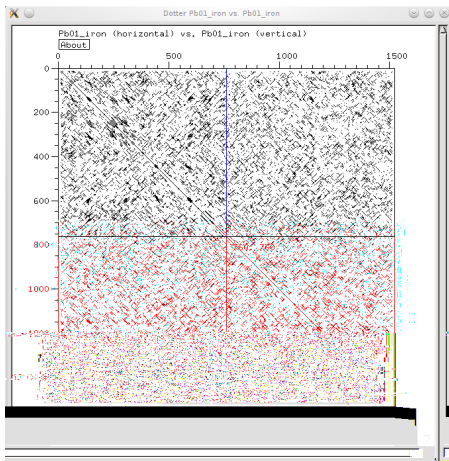

- Make sure you know what you are measuring
- Nucleic acid sequences are especially easy to address
- Many phenotypes can be analyzed by common numerical methods

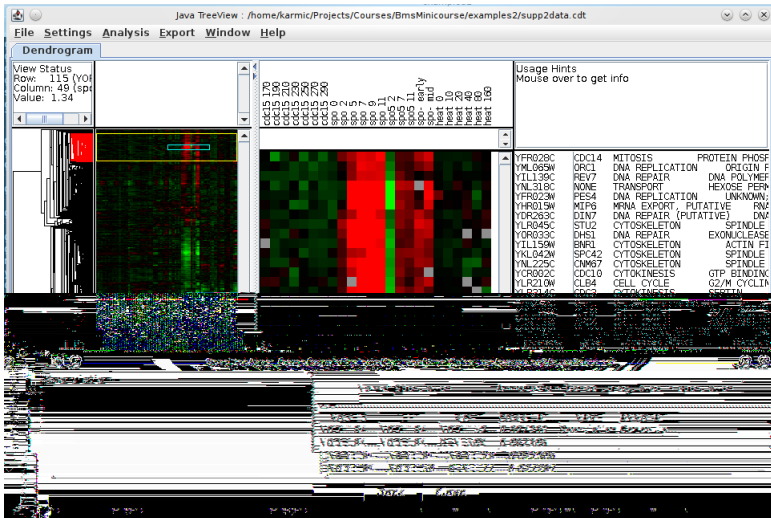

# Sequencing methods sidestep design-time decisions

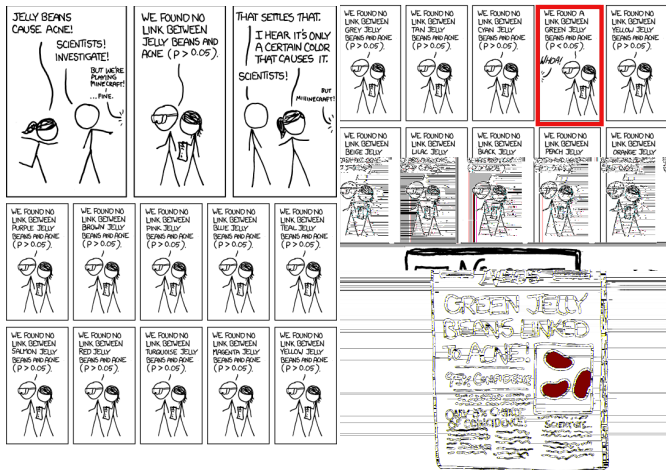

# Start from an unbiased view

# Tools should support aggregation and annotation

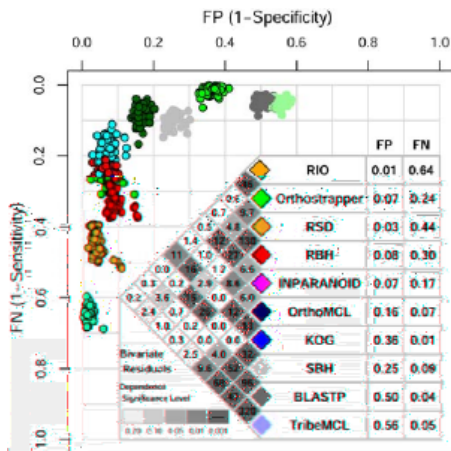

# Account for Multiple Hypothesis Testing

# Choose appropriate statistical tools

- Solid theoretical basis
- Reasonable power
- Estimates significance *and* effect size

PLoS ONE 2:e383

# Choose appropriate statistical tools

- Solid theoretical basis
- Reasonable power
- Estimates significance *and* effect size
- Addresses the question that you are asking

PLoS ONE 2:e383

# Choose appropriate statistical tools

- Solid theoretical basis
- Reasonable power
- Estimates significance *and* effect size
- Addresses the question that you are asking
- When in doubt, find positive and negative controls
