Exercise: Scoring an ungapped alignment

$$s = \left\{ \begin{array}{l} \text{"A"} : \{ \text{"A"} : 1.0, \text{"T"} : -1.0, \text{"G"} : -1.0, \text{"C"} : -1.0 \}, \\ \text{"T"} : \{ \text{"A"} : -1.0, \text{"T"} : 1.0, \text{"G"} : -1.0, \text{"C"} : -1.0 \}, \\ \text{"G"} : \{ \text{"A"} : -1.0, \text{"T"} : -1.0, \text{"G"} : 1.0, \text{"C"} : -1.0 \}, \\ \text{"C"} : \{ \text{"A"} : -1.0, \text{"T"} : -1.0, \text{"G"} : -1.0, \text{"C"} : 1.0 \} \end{array} \right\}$$

$$S(x, y) = \sum_i^N s(x_i, y_i)$$

- 1 Given two equal length sequences and a scoring matrix, return the alignment score for a full length, ungapped alignment.

Exercise: Scoring an ungapped alignment

$$s = \left\{ \begin{array}{l} \text{"A"} : \{ \text{"A"} : 1.0, \text{"T"} : -1.0, \text{"G"} : -1.0, \text{"C"} : -1.0 \}, \\ \text{"T"} : \{ \text{"A"} : -1.0, \text{"T"} : 1.0, \text{"G"} : -1.0, \text{"C"} : -1.0 \}, \\ \text{"G"} : \{ \text{"A"} : -1.0, \text{"T"} : -1.0, \text{"G"} : 1.0, \text{"C"} : -1.0 \}, \\ \text{"C"} : \{ \text{"A"} : -1.0, \text{"T"} : -1.0, \text{"G"} : -1.0, \text{"C"} : 1.0 \} \end{array} \right\}$$

$$S(x, y) = \sum_i^N s(x_i, y_i)$$

- 1 Given two equal length sequences and a scoring matrix, return the alignment score for a full length, ungapped alignment.
- 2 Given two sequences and a scoring matrix, find the offset that yields the best scoring ungapped alignment.

Exercise: Scoring a gapped alignment

- 1 Given two equal length gapped sequences (where “-” represents a gap) and a scoring matrix, calculate an alignment score with a -1 penalty for each base aligned to a gap.

Exercise: Scoring a gapped alignment

- 1 Given two equal length gapped sequences (where “-” represents a gap) and a scoring matrix, calculate an alignment score with a -1 penalty for each base aligned to a gap.
- 2 Write a new scoring function with separate penalties for opening a zero length gap (e.g., $G = -11$) and extending an open gap by one base (e.g., $E = -1$).

$$S_{gapped}(x, y) = S(x, y) + \sum_i^{gaps} (G + E * len(i))$$

Dynamic Programming

$\min((1, 2, 3, 4, 5)) = 1$

$\max((1, 2, 3, 4, 5)) = 5$

Types of alignments

Global Alignment Each letter of each sequence is aligned to a letter or a gap (e.g., Needleman-Wunsch)

Local Alignment An optimal pair of subsequences is taken from the two sequences and globally aligned (e.g., Smith-Waterman)

```

Paraphrasing from the BLAST book

- Initialize edges to 0 (*no penalty for starting in the middle of a sequence*)
- The maximum score is never less than 0, and no pointer is recorded unless the score is greater than 0
- The trace-back starts from the highest score in the matrix and ends at a score of 0 (*local, rather than global, alignment*)

Real world dynamic programming implementations

Program	files	algorithms
clustalw	pairalign.c	Myers and Miller pairwise alignment
NCBI blast	blast_gapalign.c	Gapped extension
hmmer2	core_algorithms.c, fast_algorithms.c	Forward, Backward, Viterbi

- Read chapter 3 of the BLAST book (Sequence Alignment).
- Try initializing and filling in a dynamic programming matrix by hand (e.g, try reproducing one of the examples from the BLAST book on paper).
- Try extending the Needleman-Wunsch implementation to handle non-zero gap opening penalties.
- Try implementing Smith-Waterman local alignment
